

Intrusion Detection Systems

Information Security (CSC-407)

Fall 2024 (BSE-7A & 7B)

Intruders

Intruders

- A significant security problem for **networked systems** is unwanted trespass by **users** or **software**.
- **User trespass** can take the form of:
 - *Unauthorized login*
 - *Acquisition of privileges*
 - *Performance of actions beyond authorization*
- **Software trespass** can take form of virus, worm or other malwares.

Intruder Behavior

- **Techniques** and **behavior patterns** of intruders are constantly shifting to exploit newly discovered weaknesses and to evade detection and countermeasures.
- However, intruders typically use steps from a **common attack methodology**.
- Helps security professionals to understand **adversary's tactics** beforehand.

Intruder
Behavior

Common Attack Methodology

Intruder Behavior (Cont.)

1. Target Acquisition and Information Gathering (*Footprinting and Reconnaissance*):

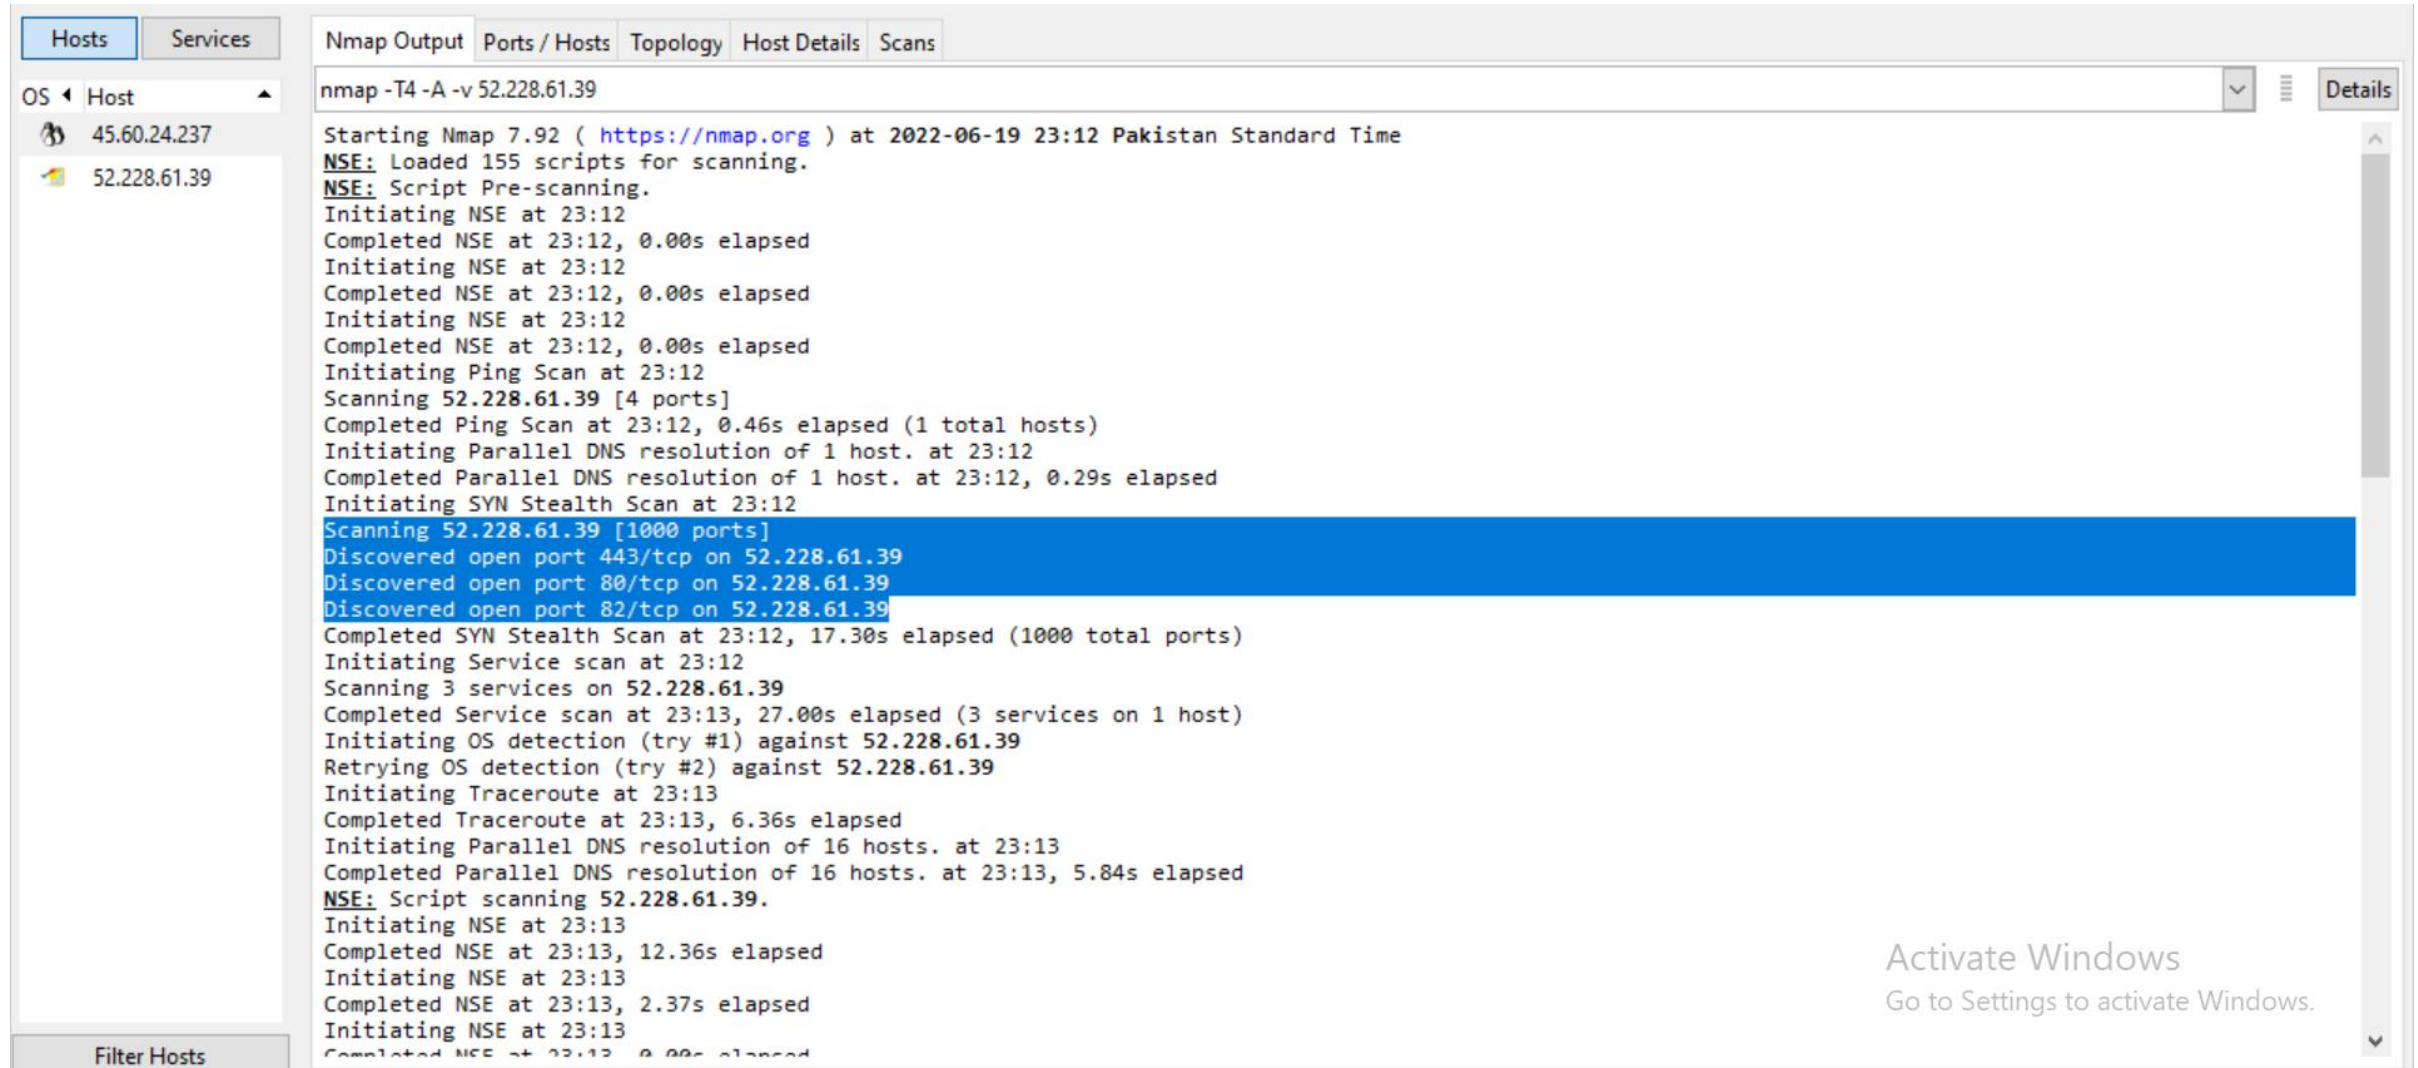

- Attacker **identifies** and **characterizes** the target systems using publicly available information, both technical and non-technical.
- Attacker uses **network exploration tools** to map target resources.
- Reconnaissance Types:
 - ***Passive Reconnaissance***: acquire information without directly interacting with target.
 - ***Active Reconnaissance***: directly interacting with the target.

Intruder Behavior (Cont.)

■ Examples:

- ✓ Explore corporate website for information on corporate structure, personnel/key systems, details of web server and OS.
- ✓ Gather information on target network using tools, such as *DNS lookup, traceroute, etc.*
- ✓ Map network for accessible services using tools such as *NMAP (Network Mapper)*.
- ✓ Send query email to customer service, review response for information on mail client/server, OS used and also details of person responding (*Social Engineering / Phishing*).

Intruder Behavior (Cont.)

The image shows a screenshot of the Nmap application interface. On the left, the 'Hosts' tab is selected, showing a list of hosts: 45.60.24.237 and 52.228.61.39. The main window displays the 'Nmap Output' for the command 'nmap -T4 -A -v 52.228.61.39'. The output text is as follows:

```
nmap -T4 -A -v 52.228.61.39

Starting Nmap 7.92 ( https://nmap.org ) at 2022-06-19 23:12 Pakistan Standard Time
NSE: Loaded 155 scripts for scanning.
NSE: Script Pre-scanning.
Initiating NSE at 23:12
Completed NSE at 23:12, 0.00s elapsed
Initiating NSE at 23:12
Completed NSE at 23:12, 0.00s elapsed
Initiating NSE at 23:12
Completed NSE at 23:12, 0.00s elapsed
Initiating Ping Scan at 23:12
Scanning 52.228.61.39 [4 ports]
Completed Ping Scan at 23:12, 0.46s elapsed (1 total hosts)
Initiating Parallel DNS resolution of 1 host. at 23:12
Completed Parallel DNS resolution of 1 host. at 23:12, 0.29s elapsed
Initiating SYN Stealth Scan at 23:12
Scanning 52.228.61.39 [1000 ports]
Discovered open port 443/tcp on 52.228.61.39
Discovered open port 80/tcp on 52.228.61.39
Discovered open port 82/tcp on 52.228.61.39
Completed SYN Stealth Scan at 23:12, 17.30s elapsed (1000 total ports)
Initiating Service scan at 23:12
Scanning 3 services on 52.228.61.39
Completed Service scan at 23:13, 27.00s elapsed (3 services on 1 host)
Initiating OS detection (try #1) against 52.228.61.39
Retrying OS detection (try #2) against 52.228.61.39
Initiating Traceroute at 23:13
Completed Traceroute at 23:13, 6.36s elapsed
Initiating Parallel DNS resolution of 16 hosts. at 23:13
Completed Parallel DNS resolution of 16 hosts. at 23:13, 5.84s elapsed
NSE: Script scanning 52.228.61.39.
Initiating NSE at 23:13
Completed NSE at 23:13, 12.36s elapsed
Initiating NSE at 23:13
Completed NSE at 23:13, 2.37s elapsed
Initiating NSE at 23:13
Completed NSE at 23:13, 0.00s elapsed
```

The scan results indicate that the target host 52.228.61.39 has three open ports: 443/tcp, 80/tcp, and 82/tcp. The scan was completed at 23:13 on 2022-06-19. A watermark 'Activate Windows' is visible in the bottom right corner of the application window.

Intruder Behavior (Cont.)

2. Initial Access:

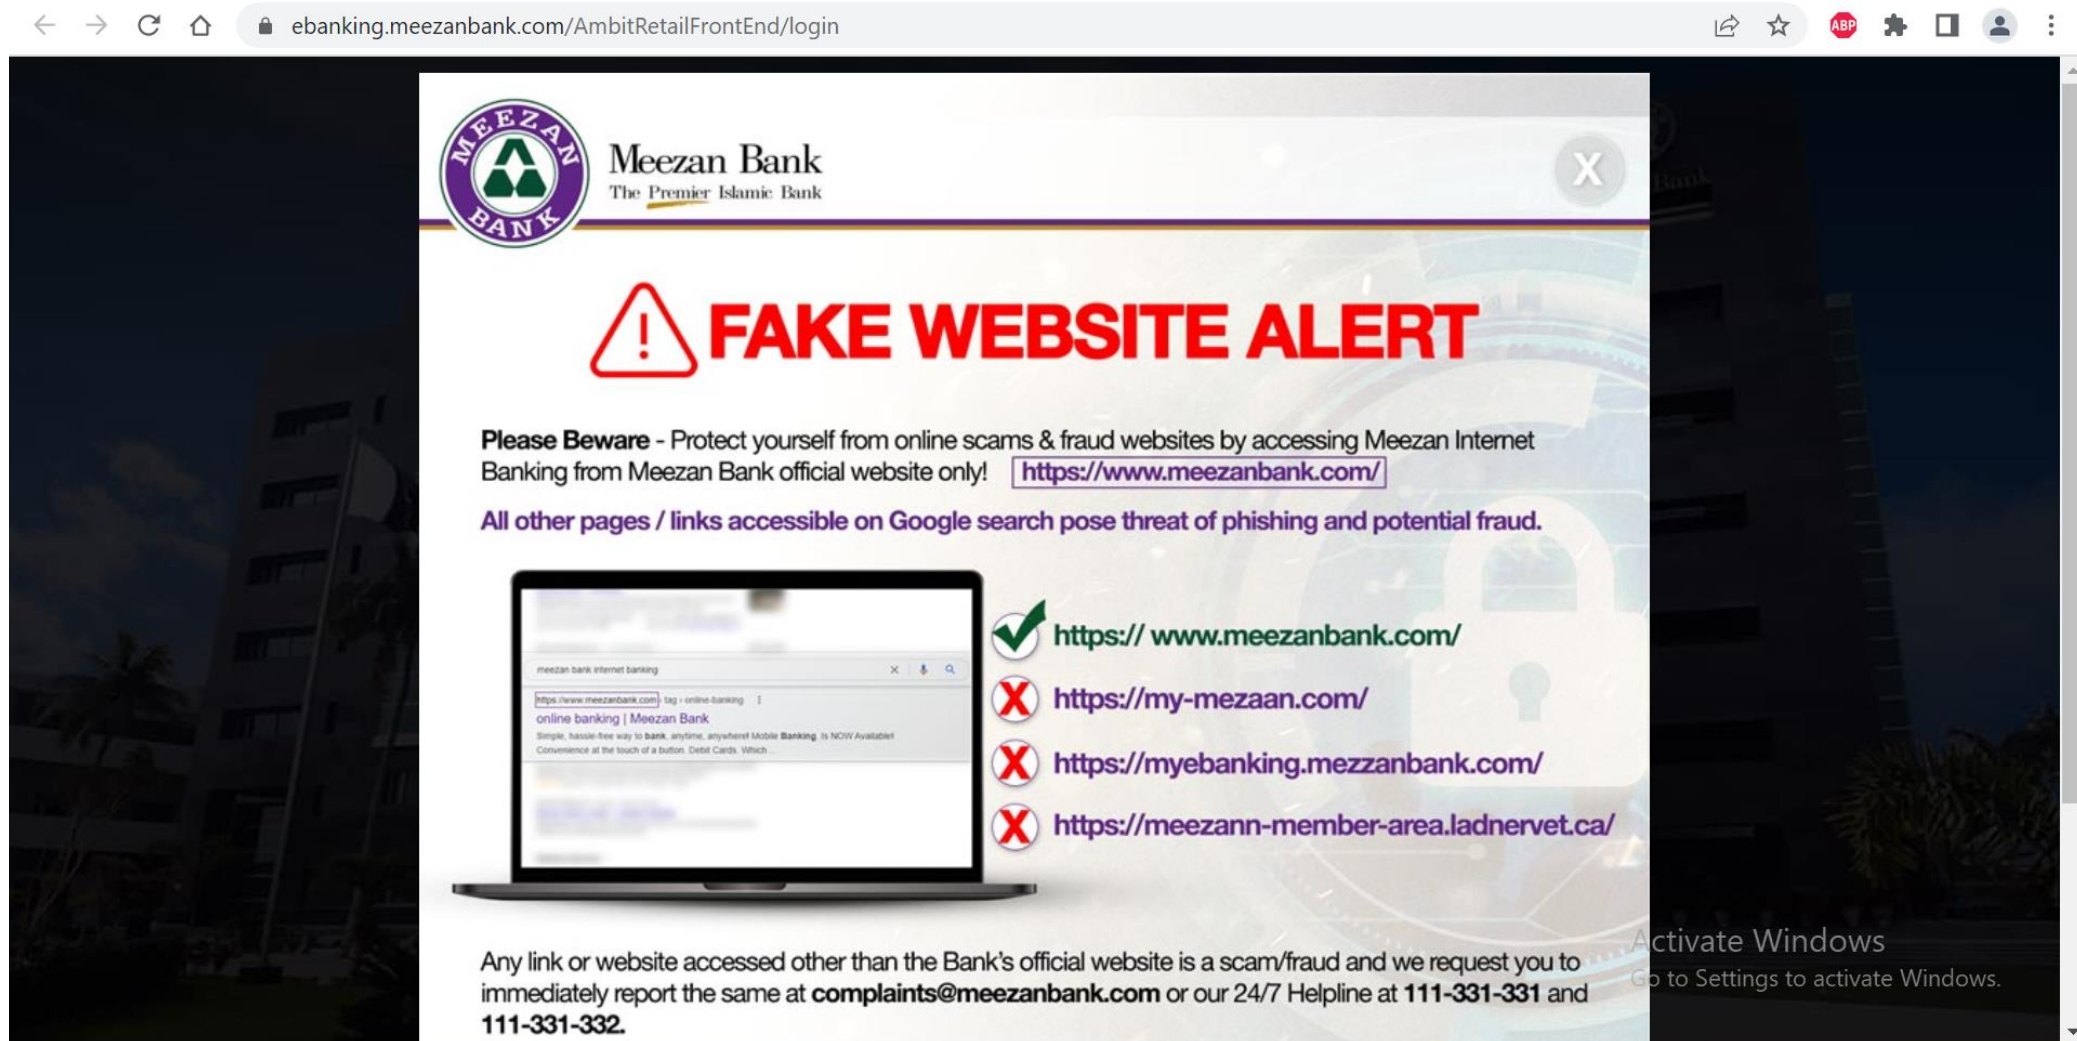

- Attackers use vulnerabilities identified during reconnaissance / scanning phase to gain access to the target system / network.
- Access to a target system, typically by *exploiting* a remote network vulnerability, such as *guessing weak authentication credentials or installation of malware*.

Intruder Behavior (Cont.)

■ Examples:

- ✓ Brute force/guess a password for user's web content management system.
- ✓ Exploit vulnerability in web CMS plugin.
- ✓ Send phishing emails with link to web browser exploit.
- ✓ Gather information through fake websites.

Intruder Behavior (Cont.)

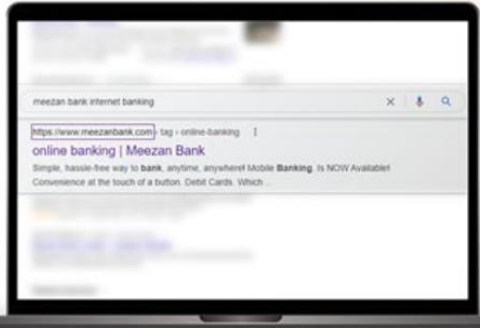

The screenshot shows a web browser window with the address bar displaying `ebanking.meezanbank.com/AmbitRetailFrontEnd/login`. The main content area features a large red warning icon and the text **FAKE WEBSITE ALERT**. Below this, a message states: "Please Beware - Protect yourself from online scams & fraud websites by accessing Meezan Internet Banking from Meezan Bank official website only! <https://www.meezanbank.com/>". It further warns that "All other pages / links accessible on Google search pose threat of phishing and potential fraud." A list of URLs is provided, with a green checkmark for the official website and red X marks for three fraudulent sites. At the bottom, it instructs users to report any other links or websites accessed.

Meezan Bank
The Premier Islamic Bank

FAKE WEBSITE ALERT

Please Beware - Protect yourself from online scams & fraud websites by accessing Meezan Internet Banking from Meezan Bank official website only! <https://www.meezanbank.com/>

All other pages / links accessible on Google search pose threat of phishing and potential fraud.

- ✓ [https:// www.meezanbank.com/](https://www.meezanbank.com/)
- ✗ <https://my-mezaan.com/>
- ✗ <https://myebanking.meezanbank.com/>
- ✗ <https://meezann-member-area.ladnervet.ca/>

Any link or website accessed other than the Bank's official website is a scam/fraud and we request you to immediately report the same at complaints@meezanbank.com or our 24/7 Helpline at 111-331-331 and 111-331-332.

Activate Windows
Go to Settings to activate Windows.

Intruder Behavior (Cont.)

3. Privilege Escalation:

- Actions taken on the system to *increase the privileges* available to the attackers to enable their desired goals on the target system.
- **Examples:**
 - ✓ Exploit any vulnerable application to gain elevated privileges.
 - ✓ Install sniffers to capture administrator passwords and use it to access privileged information.

Intruder Behavior (Cont.)

4. Information Gathering or System Exploit:

- *Access* or *modify* information or resources on the system.
- Navigate to another target system.
- **Examples:**
 - ✓ Scan files for desired information.
 - ✓ Transfer large numbers of documents to external repository.
 - ✓ Use guessed or captured passwords to access other servers on network.

Intruder Behavior (Cont.)

5. Maintaining Access:

- Enable *continued access* by the attacker after the initial attack, such as by:
 - Installation of **backdoors** or other malicious software.
 - Addition of **covert** authentication credentials.
 - Other configuration changes to the system.

Intruder Behavior (Cont.)

■ **Examples:**

- ✓ Install Remote Administration Tool (RAT) with backdoor for later access.
- ✓ Install rootkits at kernel level to gain full administrative access to the target computer.
- ✓ Use administrator password to later access network.
- ✓ Modify/disable anti-virus, firewall or IDS programs running on system.

Intruder Behavior (Cont.)

6. Covering Tracks:

- Attacker *disables* or edits *audit logs* to remove evidence of attack activity.
- Attacker *uses rootkits* and other measures to hide covertly installed files or code.
- **Examples:**
 - ✓ Use rootkit to hide files installed on system.
 - ✓ Edit log files to remove entries generated during the intrusion.

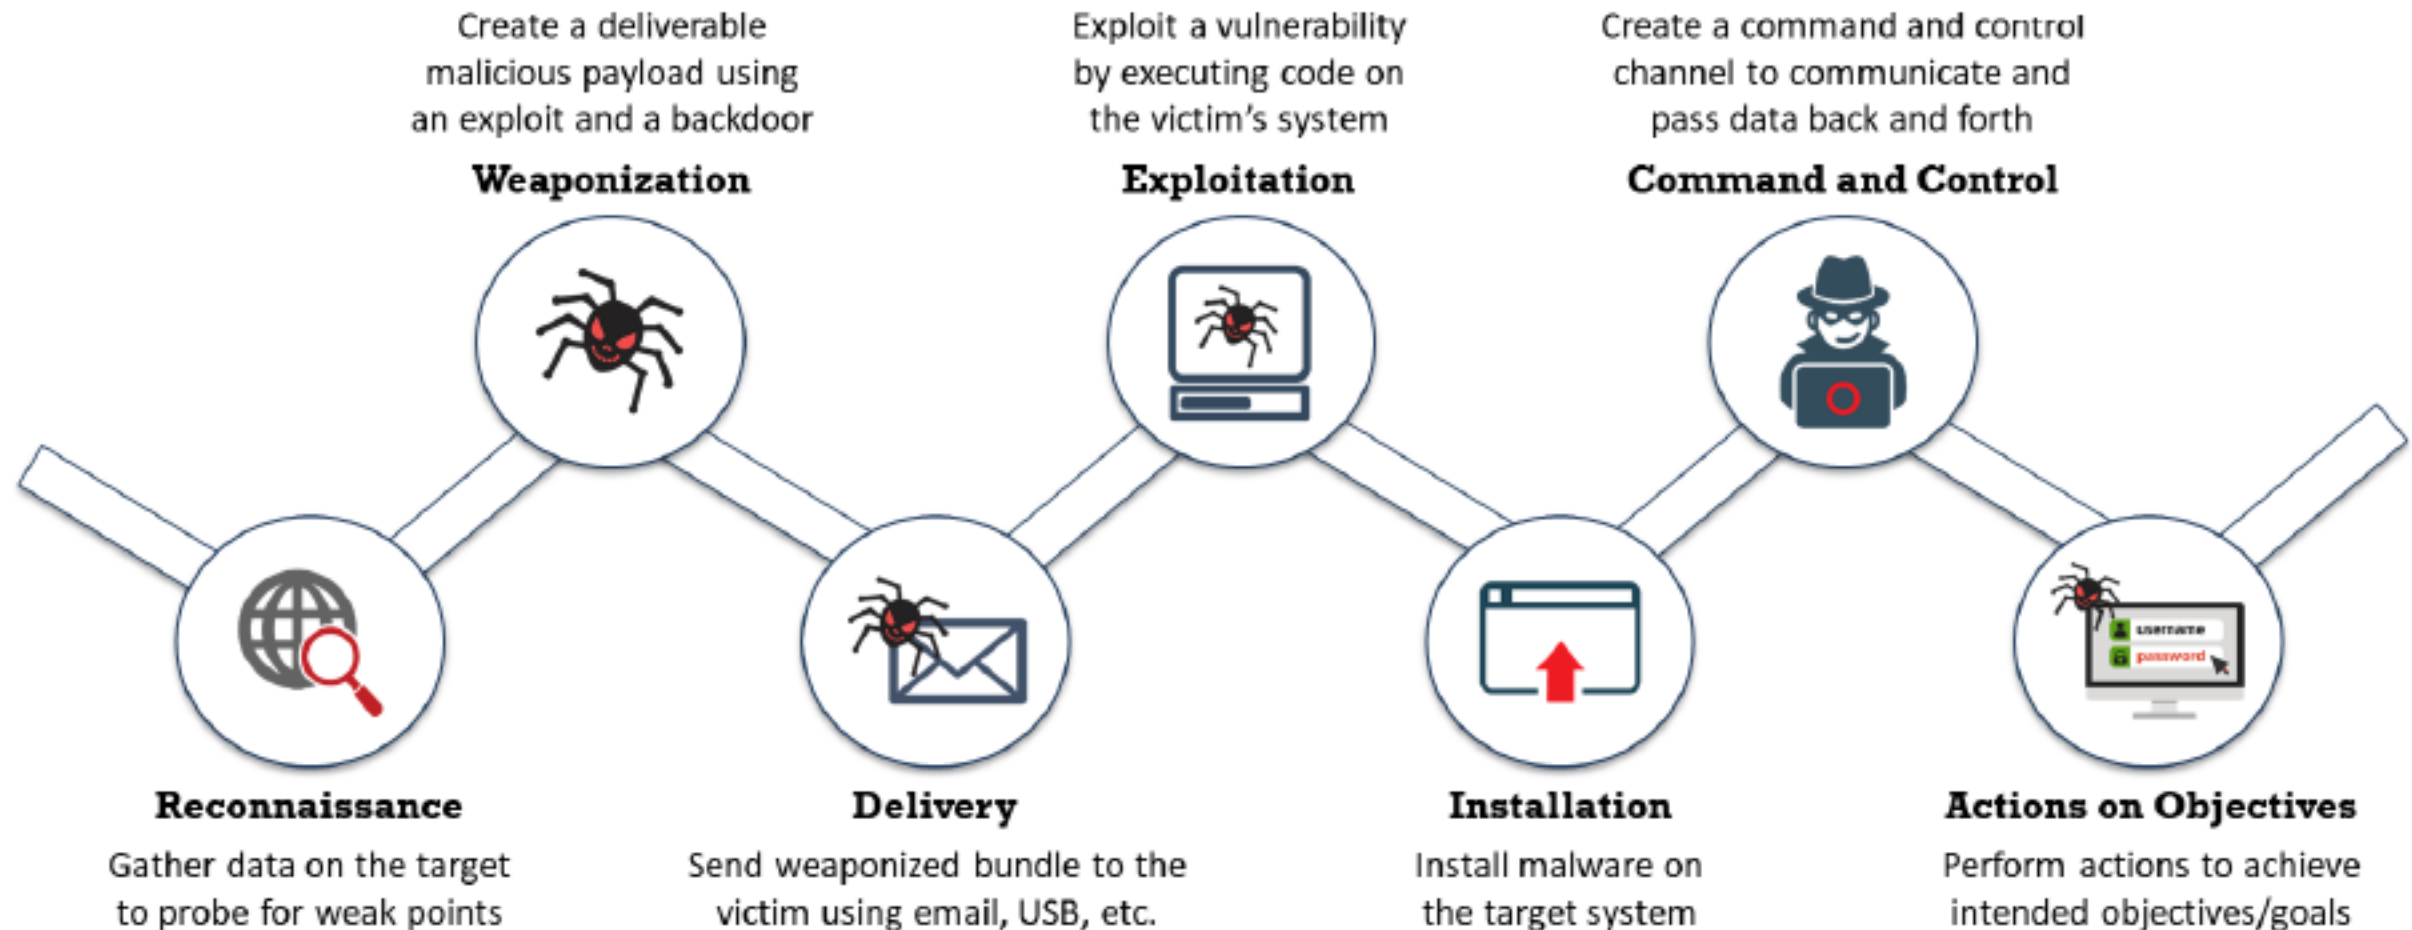

Cyber Kill Chain Methodology

- **Cyber Kill Chain Methodology;** a method by **Lockheed Martin** based on concept of *military kill chains**.
- **Cyber Kill Chain Methodology is** another framework that helps security professionals to understand the adversary's tactics, techniques, and procedures beforehand.
- A **seven-phase** protection mechanism to mitigate and reduce cyber threats.

**A concept that originated within the United States military to model the sequential steps that must be conducted in order to successfully plan and deliver an attack and deliver a “kill” (delivery of the objective and destruction of a target).*

Cyber Kill Chain Methodology (Cont.)

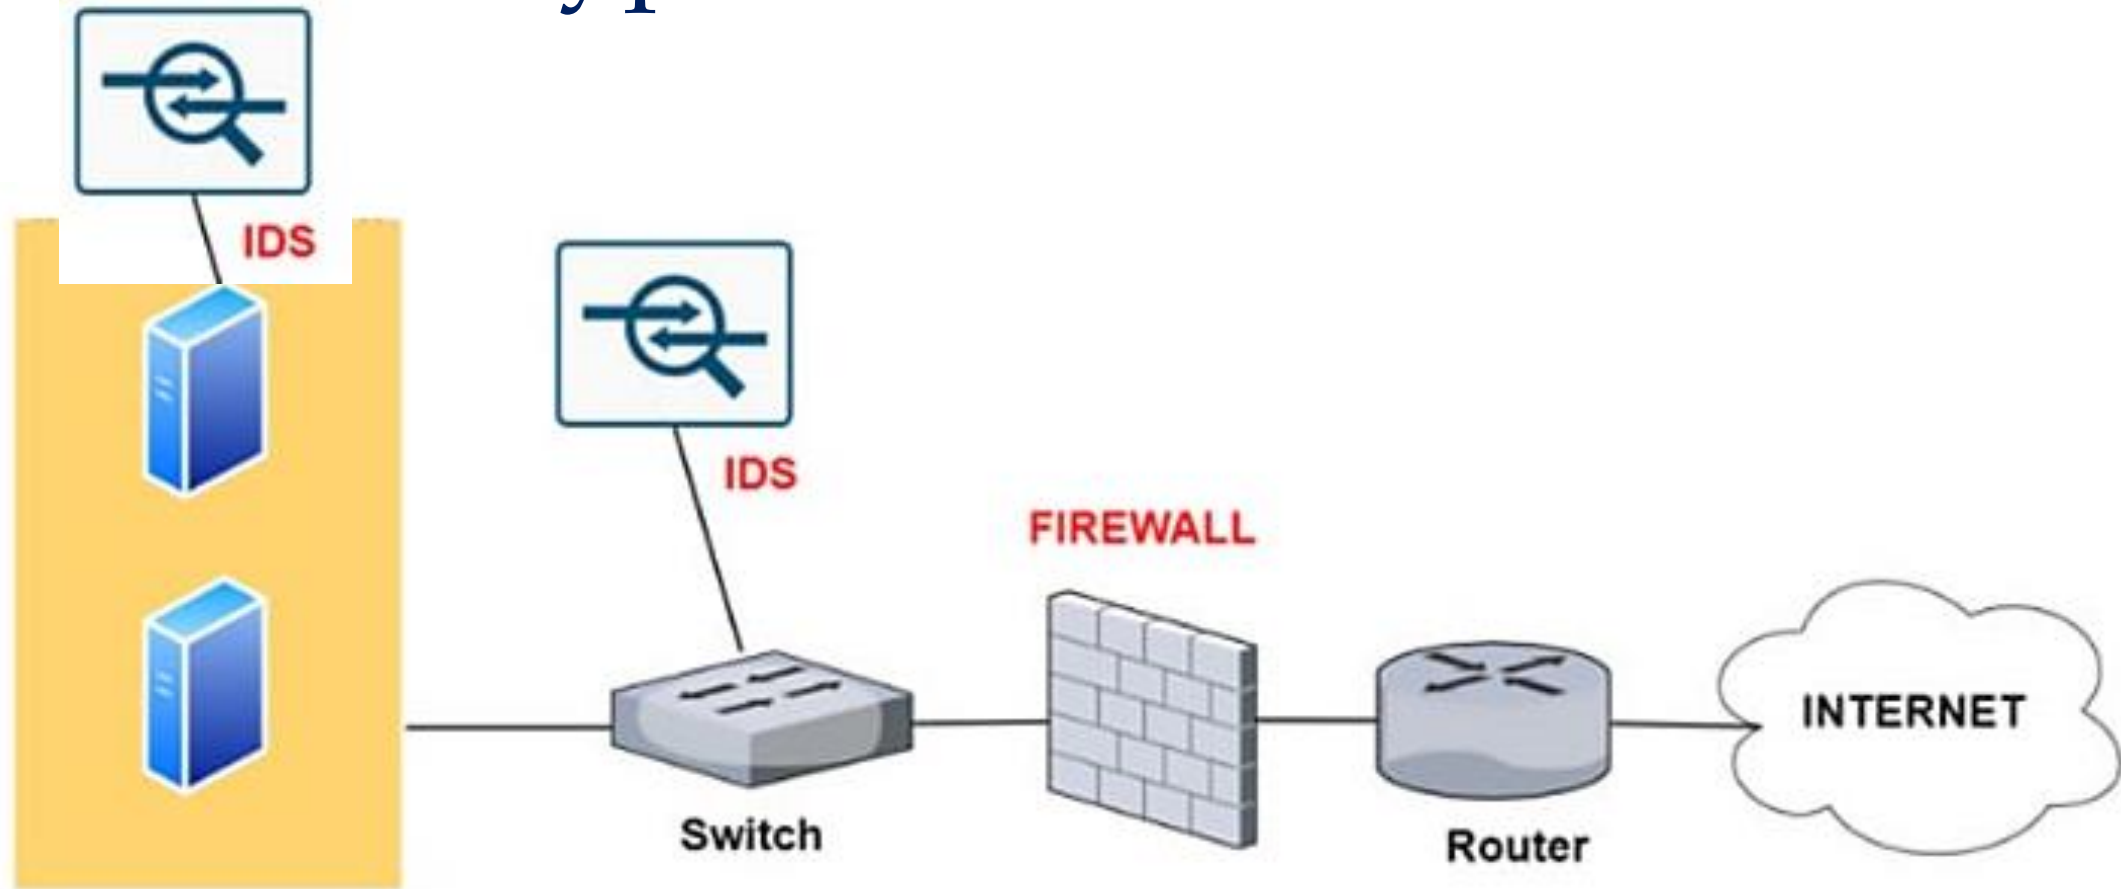

Intrusion Detection System

Intrusion Detection

- **Intrusion Detection:** a **security service** that *monitors* and *analyzes* system events for providing *real-time warning* of attempts to access system resources in an unauthorized manner.
- **Intrusion detection** is a line of defense which has been the focus of much research in recent years.
- **Note:** **authentication**, **access control** and **firewalls** all play roles in countering intrusions.

Typical IDS Placement

Intruder vs. Legitimate User Behavior

- Intrusion detection is based on the **assumption** that behavior of an **intruder** differs from that of a **legitimate user** in ways that can be **quantified**.
- However, we cannot expect that there will be an exact distinction between an **intruder** and an **authorized user**.
- Though the typical **behavior** of an intruder differs from the typical behavior of an authorized user, there is an **overlap** in these behaviors as well.

Profiles of Behavior of Intruders and Authorized Users

False Detection

- In general, the IDS cannot provide accurate detection. Hence, the alarms generated by an IDS can be categorized as:
 1. **False positives (false alarms)**: authorized users are identified as intruders **OR** benign activity is identified as malicious.
 2. **False negatives**: intruders are not identified as intruders **OR** malicious activity is failed to be identified.
- **Note**: while every **intrusion** is an **incident**, not every **incident** is an **intrusion**.

False Detection

- It is not possible to eliminate both **false positive** and **false negative**, as reducing one of the errors has an effect of increasing the other.
- It is intuitive that organizations prefer to reduce the **false negatives** at the cost of an increased **false positive**.

IDS / IPS

- **Intrusion detection systems (IDS)** and **intrusion prevention systems (IPS)** are designed to **detect** and **counter** different threats.
- **IDS / IPS** can be reasonably effective against *known and less sophisticated attacks*. However, **IDS / IPS** are likely to be less effective against *more sophisticated and targeted attacks*. **Why?**
- The sophisticated attacks are more likely to use *new, zero-day exploits* and *attackers can better hide their activities* on the targeted system.

IDS / IPS (Cont.)

- Hence **IDS / IPS** need to be part of a **defense-in-depth** strategy.
This may include:
 - Detailed audit trails
 - Application level security
 - Encryption of sensitive information
 - Active management of operating system
 - Strong authentication and authorization controls

IDS Components

An IDS comprises three logical components:

1. Sensors:

- Responsible for collecting data.
- Input for a sensor may be any part of a system that could contain evidence of an intrusion.
- Types of input to a sensor includes *network packets, log files,* and *system call traces*.
- Sensors collect and forward this information to the **analyzer**.

IDS Components (Cont.)

An IDS comprises three logical components (Cont.):

2. Analyzers:

- Receive input from one or more sensors or from other analyzers.
- Responsible for **determining** if an intrusion has occurred.
- Output is an **indication** that an intrusion has occurred.

3. User interface:

- The user interface enables a user to view output from the system or control the behavior of the system.

IDS Analyzer

Analysis Approach

- **Signature detection**: uses a set of known *malicious data patterns (signatures)* that are compared with current behavior to decide if is that of an intruder.
- **Anomaly detection**: involves the collection of data relating to *behavior of legitimate users* over a *period of time*.

Signature Detection

- Signature detection approaches **match** a large collection of *known patterns* against data stored on a system or in transit over a network.
- Signature approaches detect intrusion by observing events in the system and applying a **set of signature patterns** to data.
- **E.g.** *bytes flow / size* in network traffic **OR** a *series of instructions*.

Signature Detection (Cont.)

- Signature detection approaches **directly** define *malicious / unauthorized* behavior, hence can quickly and efficiently identify known attacks.
- Signatures need to be large enough to minimize the **false alarm rate**, while still detecting a sufficiently large fraction of malicious data.
- However, signature approaches can only identify **known attacks** for which it has patterns.

Signature Detection (Cont.)

➤ Advantages:

- Relatively low cost in-terms of time and resource usage
- Wide acceptance

➤ Disadvantages:

- Significant effort required to constantly identify and review new malware to create signatures able to identify it
- Inability to detect zero-day attacks

Anomaly Detection

- Anomaly approaches aim to define *normal or expected behavior* to identify *malicious or unauthorized behavior (i.e. variation from the norms)*.
- Involves first **developing a base-line model** of legitimate user behavior by collecting and processing sensor data from the normal operation of the monitored system in a **training phase**.
 - *This may occur at different times, or there may be a continuous process of monitoring and evolving the model over time.*

Anomaly Detection (Cont.)

- Once this model exists, the current observed behavior is analyzed to **classify** if the behavior is of a legitimate user or of an intruder.
- Only anomaly detection is able to detect **unknown, zero-day attacks**, as it starts with known good behavior and identifies anomalies to it.

Anomaly Detection (Cont.)

- A variety of classification approaches are used which can be broadly categorized as:

Statistical

- Analysis of the observed behavior using **univariate**, **multivariate** or **time-series** models of observed metrics.

Knowledge based

- Approaches use an **expert system** that classifies observed behavior according to a set of rules that model legitimate behavior.

Machine-learning

- Approaches determine a suitable classification model from the training data using data mining techniques.

Anomaly Detection (Cont.)

Statistical Approaches:

- Use the captured sensor data to develop a **statistical profile** of the observed metrics.
- In **univariate** models, each metric is treated as an **independent** variable.
- **Multivariate** models consider **correlations** between metrics.
- **Time-series** models use the **order** and **time difference** between observed events to better classify the behavior.

Anomaly Detection (Cont.)

Statistical Approaches (Cont.):

➤ Advantages:

- Relative simplicity
- Low computation cost

➤ Disadvantages:

- Difficulty in selecting suitable **metrics** to obtain reasonable balance between **false positives** and **false negatives**
- **Not all behaviors** can be modeled using statistical approaches

Anomaly Detection (Cont.)

Knowledge-Based Approaches:

- Classify the observed data using a *set of rules*.
- These rules are developed, *usually manually*, during the training phase to characterize the observed training data into *distinct classes*.
- Rules and classes are then used to classify the observed data in the detection phase.

Anomaly Detection (Cont.)

Knowledge-Based Approaches (Cont.):

➤ Advantages:

- Flexibility (*upto the rule maker experience*)

➤ Disadvantages:

- Need for *human experts* to assist with development of rules
- Difficulty and much time required to develop a *high-quality knowledge / rules* from data

Anomaly Detection (Cont.)

Machine-Learning Approaches:

- Use **data mining techniques** to develop a model using the labeled normal training data.
- This model is then able to classify subsequently observed data as either normal or anomalous.
- A variety of machine-learning approaches have been tried, with varying success, such as *Bayesian networks, Neural networks, Genetic algorithms, etc.*

Anomaly Detection (Cont.)

Machine-Learning Approaches (Cont.):

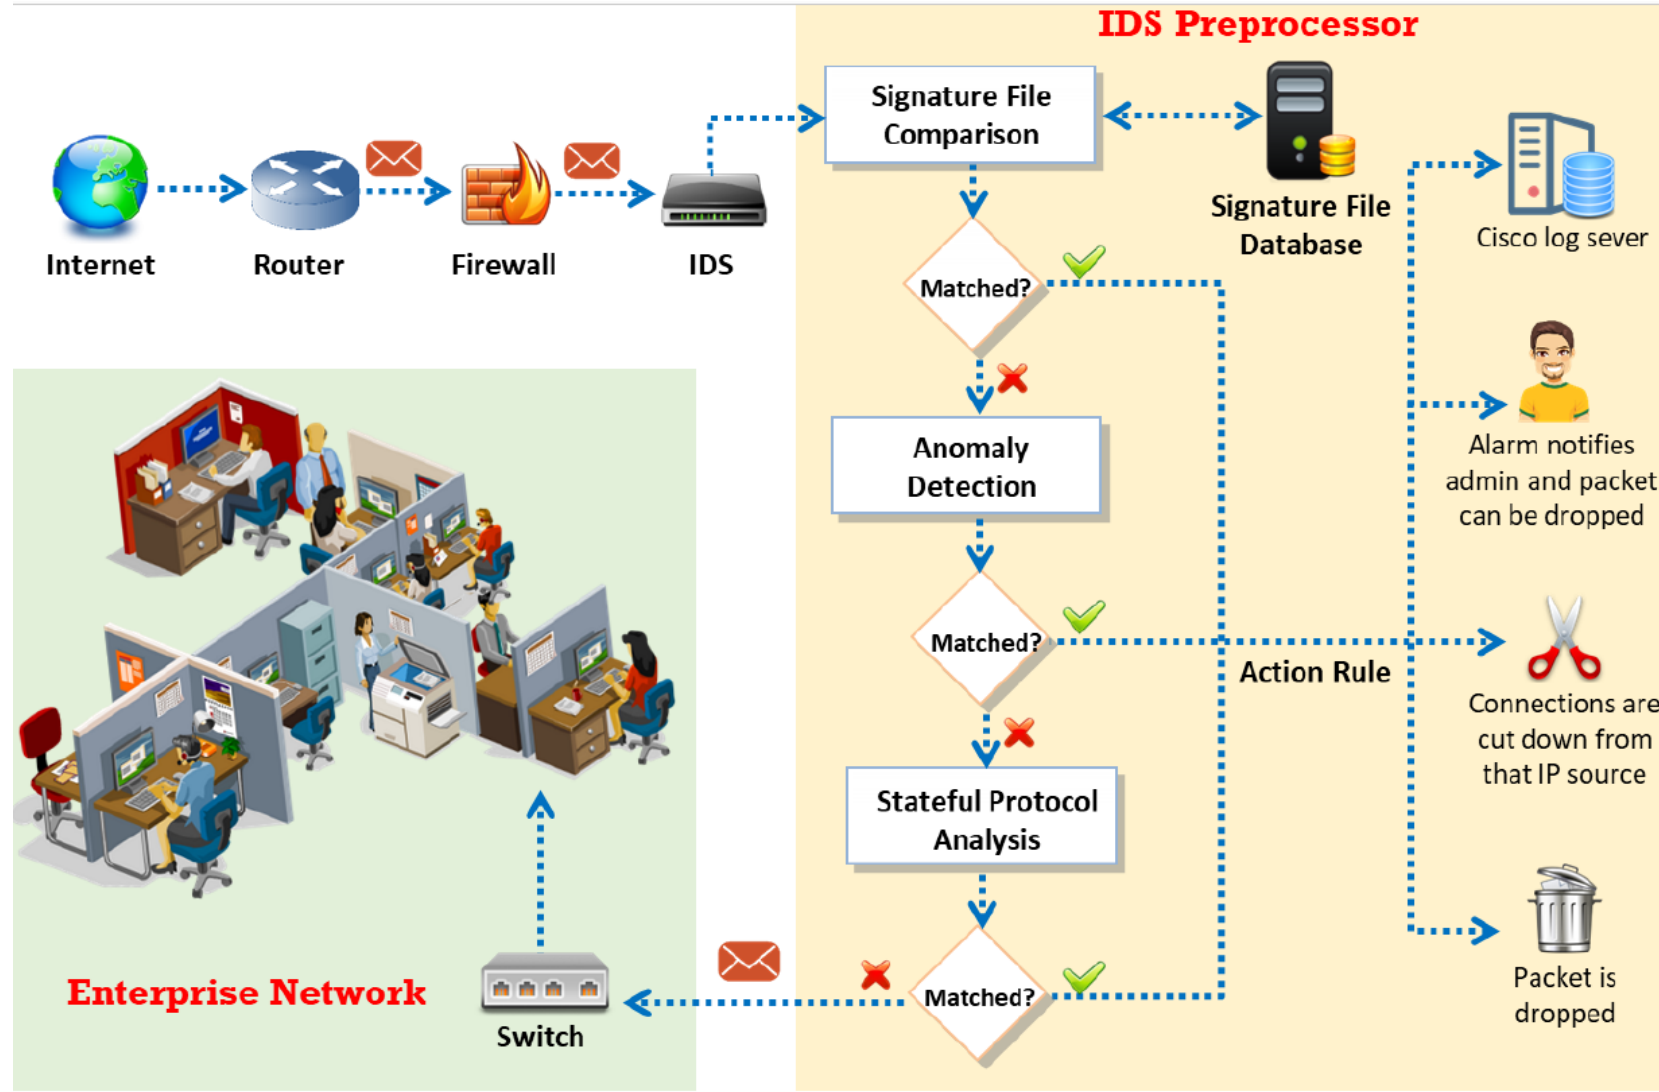

➤ Advantages:

- Adaptability

➤ Disadvantages:

- Model generation typically requires *significant time* and *high computational resource* cost
- Dependency on *training data*

Signature & Anomaly

Signature & Anomaly (Cont.)

- In **signature-based IDS**; network traffic is checked with any of the signatures in the *signature file database*.
 - If no match found → forward to Anomaly-based IDS.
- In **anomaly-based IDS**; statistical/knowledge based/ML techniques is used to compare monitored traffic with the *normal traffic profile*.
 - If no match found → forward to Stateful Protocol Analysis.

Signature & Anomaly (Cont.)

- If **match found** in any of three stages of intrusion detection, then possible actions include:
 - *Disconnect connection from **source IP***
 - *Drop packet*
 - *Log activity*
 - *Generate an alarm*
- If **no match found** in any of three stages of intrusion detection, then *pass to the destined network.*

HIDS/NIDS

V E R I S Y S

IDS Classification

- **IDSs** can be classified based on the **source of data** analyzed:
 - **Host-based IDS (HIDS):** monitors the characteristics of a **single host** and the events occurring within that host, such as **process identifiers** and **system calls**.
 - **Network-based IDS (NIDS):** monitors **network traffic** for particular network segments or devices and analyzes different **protocols** to identify suspicious activity.

IDS Classification (Cont.)

Host-based IDS

Host-Based IDS

- **HIDS** adds a layer of **security software** to vulnerable or sensitive systems, such as **database servers / file server**.
- The **HIDS** monitors activity on a particular system in a variety of ways to detect suspicious behavior.
- **HIDS** examines **user** and **software activity** on a host.
- The primary benefit of a **HIDS** is that it can detect **internal intrusions**, something that is not possible with **NIDS**.

Host-Based IDS (Cont.)

Host-Based IDS (Cont.)

- **Common data sources in HIDS include:**
 - *System call traces*
 - *File integrity checksums (hash)*
 - *Audit (log file) records*
 - *Registry access*
- **HIDS** can use either **anomaly** or **signature** approaches to detect unauthorized behavior on the monitored host.

Anomaly HIDS

- The majority work on **anomaly HIDS** has been done on *Unix* and *Linux* systems due to the ease of gathering suitable data required for this purpose (*e.g. open source*).
- Windows have “traditionally” not used **anomaly HIDS**.

Anomaly HIDS (Cont.)

Anomaly HIDS through System Calls:

- Majority of the **anomaly HIDS** is based on **system call traces**.
- The **current process** behavior is examined using a suitable decision engine that analyzes **system call traces**.
- **E.g.** performing **write()** operations on read-only file where only **read()** operation should be performed.

Anomaly HIDS (Cont.)

Anomaly HIDS through System Calls (Cont.):

- Initial works compared the observed sequences of **system calls** with sequences from the **training phase** to obtain a **mismatch ratio** that determines whether the sequence is normal or not.
- Later work used **Machine Learning** algorithms to make classification. These algorithms are reported to provide reasonable intruder detection rates of **95-99%** while having **false positive rates** of less than **5%**.

Anomaly HIDS (Cont.)

Anomaly HIDS through System Calls (Cont.):

- *Examples of Ubuntu Linux System Calls: accept, access, acct, adjtime, aiocancel, aioread, aiowait, aiowrite, alarm, async_daemon, auditsys, bind, chdir, chmod, chown, chroot, close, connect, creat, dup, dup2, execv, execve, exit, ETC...*
- **Advantage:** **System call traces** provides the richest information source for a **HIDS**.
- **Disadvantage:** it imposes a moderate load on the monitored system to gather and classify data.

Anomaly HIDS (Cont.)

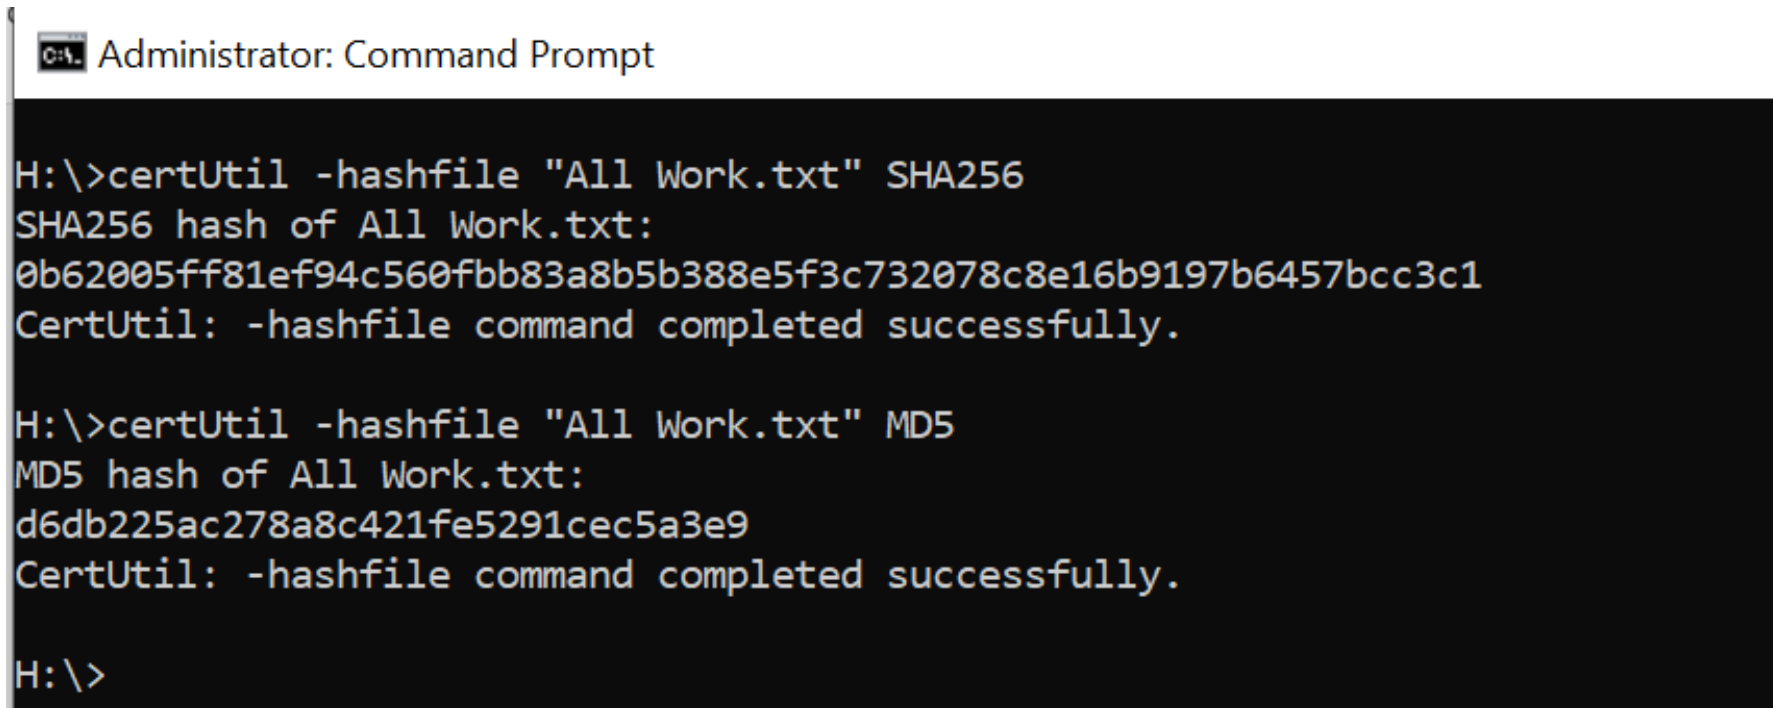

Anomaly HIDS through Monitoring of Files:

- An alternative to examining *current process* behavior is to look for changes to *important files* on monitored host.
- **HIDS** benchmark and monitors the status of **key system files** and detect when an intruder creates, modifies, or deletes monitored files.
- **HIDS** uses a *cryptographic checksum* to check for any changes from the known good baseline for the monitored files.
- Typically, all **program binaries, scripts** and **configuration** files are monitored, either on **each access** or on a **periodic scan**.

Anomaly HIDS (Cont.)

- Run as Administrator “cmd” and type:

certUtil -hashfile "All Work.txt" SHA256

```
Administrator: Command Prompt

H:\>certUtil -hashfile "All Work.txt" SHA256
SHA256 hash of All Work.txt:
0b62005ff81ef94c560fbb83a8b5b388e5f3c732078c8e16b9197b6457bcc3c1
CertUtil: -hashfile command completed successfully.

H:\>certUtil -hashfile "All Work.txt" MD5
MD5 hash of All Work.txt:
d6db225ac278a8c421fe5291cec5a3e9
CertUtil: -hashfile command completed successfully.

H:\>
```

Anomaly HIDS (Cont.)

Anomaly HIDS through Monitoring of Files (Cont.):

- **Advantage:** **very sensitive** to changes in the monitored files, as a result of intruder activity or for any other reason.
- **Disadvantage:**
 - Difficulty in determining **which files to monitor**.
 - Difficulty in having access to a **known good copy** of each monitored file **to establish baseline value**.
 - Difficulty in protecting the **database of file signatures**.

Signature HIDS

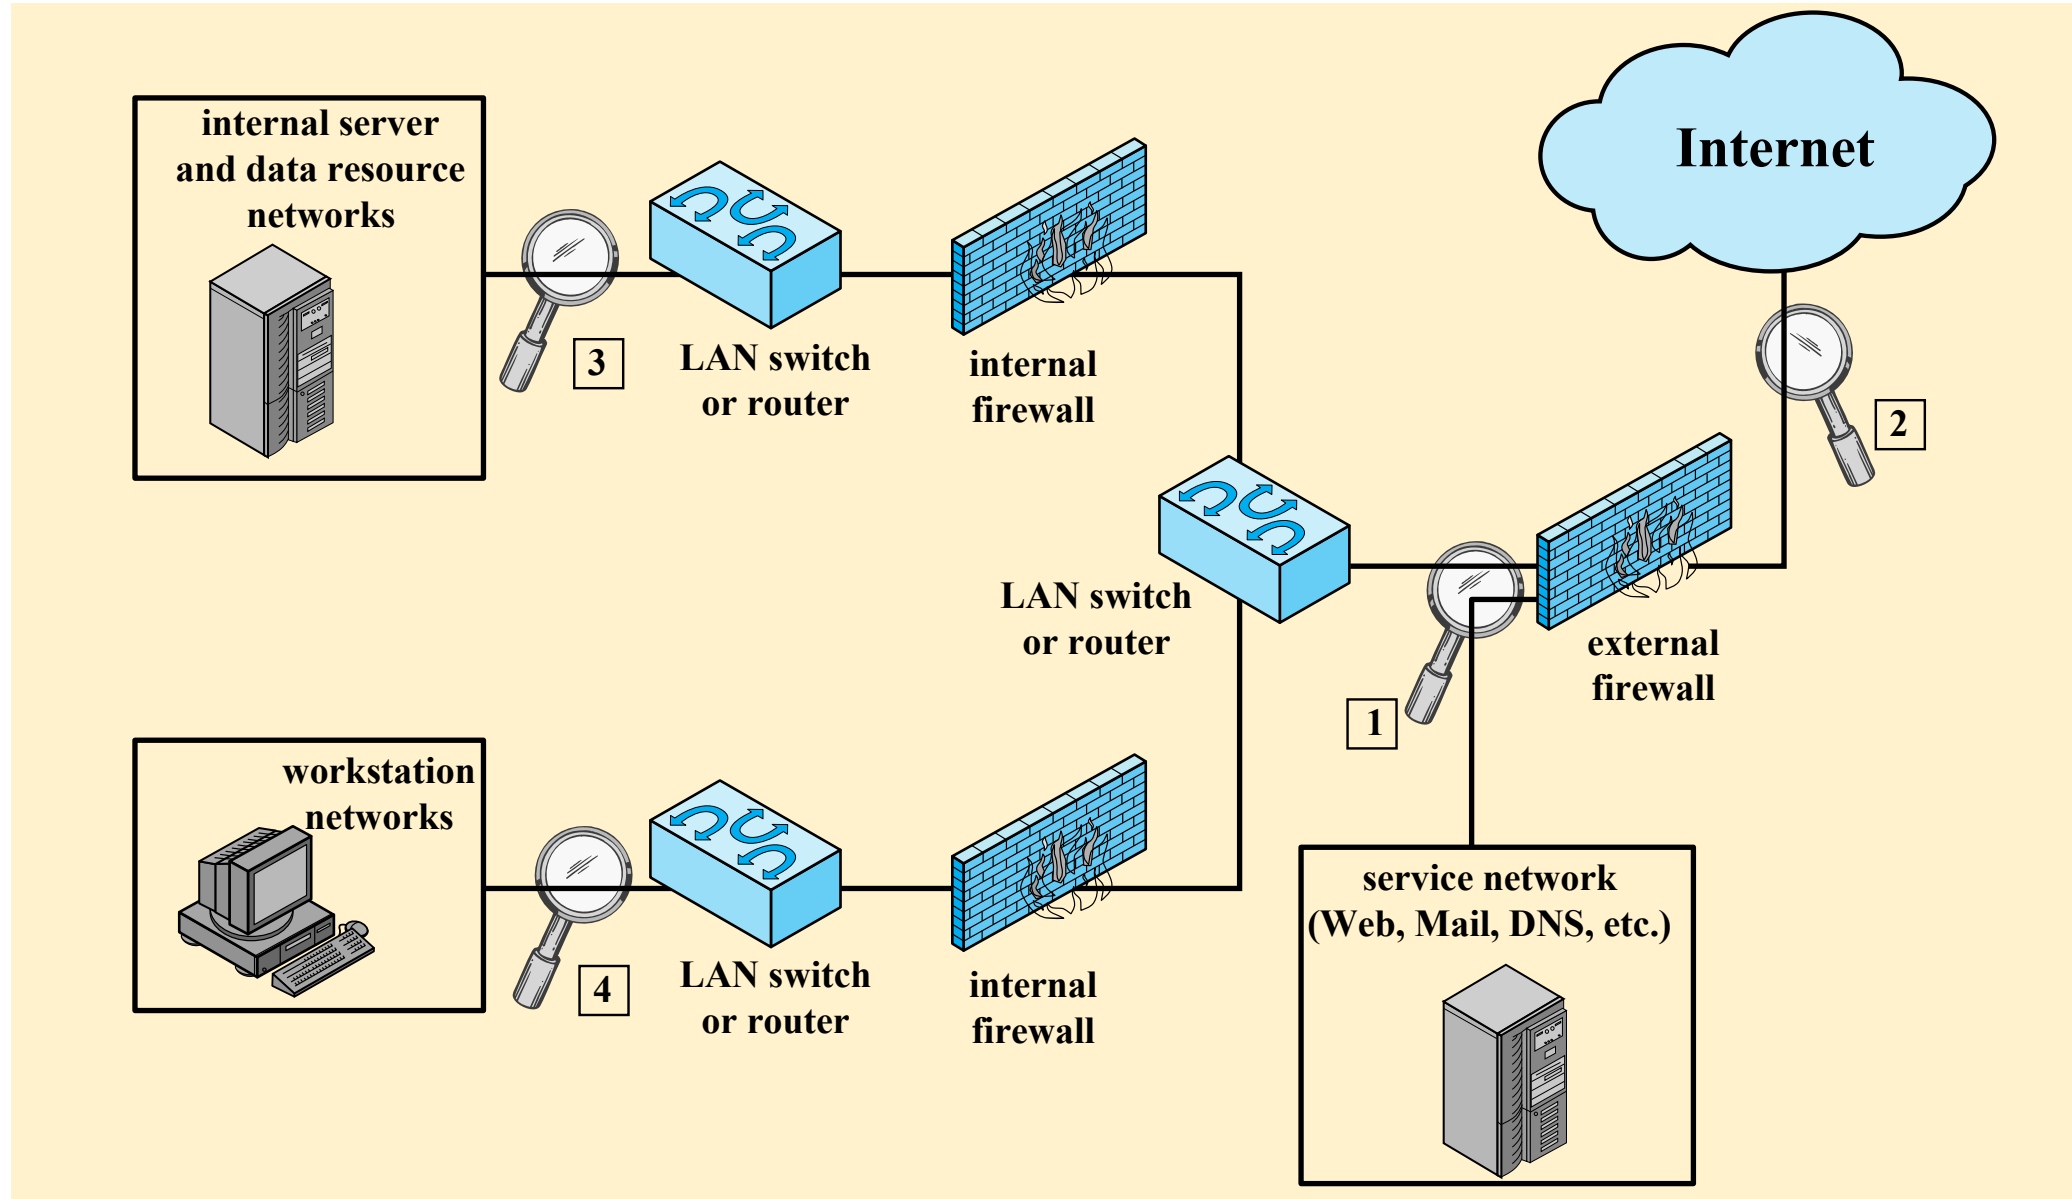

- The **signature HIDS** is widely used, particularly as seen in **anti-malware** products.
- These are commonly used on *Windows systems*.
- They use a database of **file signatures** which are patterns of data found in known malicious software.
- Efficient at detecting **known malware**, but not capable of detecting **zero-day attacks** that do not have known signatures.

Network-based IDS

Network-Based IDS

- **NIDS** examines the traffic **packet by packet** in real time, or close to real time, to attempt to detect intrusion patterns.
- **NIDS** examines packet traffic directed toward potentially vulnerable systems on a network.
- **NIDS** may examine **network-**, **transport-**, and **application-**layer protocol activity.
- **NIDS** monitors traffic at **selected points** on a network. Typically in the *border security infrastructure* of an organization, either incorporated in or association with the **firewall**.

Example of **NIDS** Deployment

Network-Based IDS (Cont.)

- **NIDS** typically focus on monitoring for **external intrusion** attempts by analyzing both **traffic patterns** and **traffic content**.
- However, with the increasing use of **encryption**, **NIDS** have lost access to significant content, hence hindering their ability to function well.
- As with **HIDS**, **NIDS** also makes use of **signature detection** and **anomaly detection** approaches.

Anomaly NIDS

Type of attacks that anomaly NIDS can detect:

- **Denial-of-service (DoS) attacks:** to **overwhelm** the target system by either significantly increased packet traffic or significantly increase connection attempts.
- **Scanning:** an attacker probes a network or system by sending different kinds of packets. Using the responses received from the target, the attacker can learn many of the system's **characteristics** and **vulnerabilities**. Scanning can be detected by a typical **flow patterns** at different communication layers.

Anomaly NIDS (Cont.)

Type of attacks that anomaly NIDS can detect (Cont.):

- **Worms:** worms spread among hosts, where some worms propagate quickly and *use large amounts of bandwidth*. Worms can also be detected because they can *cause hosts to communicate with each other* that typically do not. Also, worms can *cause hosts to use ports that they normally do not use*.

Signature NIDS

Type of attacks that signature NIDS can detect:

- Signature-based NIDS are effective at detecting common and well-known attacks.
- However, it cannot detect new or unknown attacks.

Thank You!
